

Two functions meet in a common entrance hall preceded by Beursplein square, with a covered outdoor intermediate space between square and building under an imposing cantilever. The building fits seamlessly in the perimeter of the 50-year-old beech trees. It took great precaution and care to keep the old trees alive during the construction of this new building. The materialization consists of glass to create openness and transparency and red-brown brick to create a robust building that fits in with the environment.

Moreover, it seeks added value by organizing new kinds of events by combining the exhibition hall with a congress facility. The congress part consists of three functions: auditorium, meeting rooms and a catering area.
